

We are your local expert on all repairs using structural, polyurethane resins.

Our goal is to provide a permanent solution with as little disruption as possible to your workflow. Whether pre-construction or existing structure, residential or commercial, we are prepared to provide a plan for your next project.

Concrete Lifting and Void fills

- Two component, high density, structural, polyurethane resins used to lift and level concrete without excavation; on average this process is 50% less expensive than tear out and replace.
- Very little downtime; treated areas are ready for normal foot traffic within 15 minutes.
- Lightweight material (3.5 lbs per cubic foot) so there is less stress on already weak soil while still maintaining structural support (14,000 lbs/sqft in a free rise state)

Soil Stabilization

- Single component, hydrophobic polyurethane resin used to stabilize soil and seal leaks without the need to excavate.
- Hydrophobic resin displaces moisture from the soil while permeating all areas around injection, creating a solid, water impermeable barrier.
- Pre-construction curtain walls to mitigate erosion risks from site development.

Leak Seal

- Single component, water activated, closed cell polyurethane injection resin that serves as a powerful leak seal to shut down high-flow, underground leaks.
- Optimal for sealing pipe penetrations, hairline cracks, joints and larger defects in concrete structures.
